

**ARTEC Acoustic EQ "SE-QE3" Modification for switching between two input signals over a stereo input jack. The tip will be lead through the EQ (LED on) and the sleeve will be bypassed (LED off).**

This is the original state of the device

Now I just cut two circuit paths (one is on the other side) to eliminate the original bypass function. Solder the battery earth to the middle sleeve of the output (battery will disconnect when you pull output jack). Then connect the output tip with the middle sleeve of the input jack (#1 orange wire). Then Connect the middle sleeve of the output jack with the BATT- Solderpoint (#2 orange wire). That's it.
